

FiltraQueri

UX / UI Design Guide

An Epic-structured, calm analytics experience

Six destinations . one consistent shell . invisible intelligence

Companion to the UX Overhaul Master Plan and the four canonical specifications.

1 The design approach

FiltraQueri's users are people whom SQL, dashboards, and traditional BI tools have already overwhelmed. The design has one job: let them analyze data without ever feeling that. It does this by borrowing the navigation discipline of Epic-class enterprise systems — and deliberately rejecting their density.

What we borrowed from Epic-class systems

- **Focused destination navigation** — the user travels to a destination, and that destination fills the screen with one context.
- **The quick-link tile model** — a calm grid of clear, single-purpose doors on the landing screen.
- **Structured navigation layers** — a stable destination bar, a focused sub-view, a detail page — and the user always knows which layer they are on.
- **Fresh-page composition** — every destination is composed deliberately, never assembled by stacking modules.
- **Reliable back navigation** — one predictable way to return, everywhere.

What we deliberately did NOT borrow

Epic-class systems are visually dense because clinicians live in them for hours and trade calm for throughput. FiltraQueri's user is the opposite — occasional, non-technical, easily overwhelmed. So the design keeps the structure and keeps the calm: generous whitespace, one focal point per screen, restrained colour, plain language, one obvious next step.

"Borrow the navigation discipline. Keep the calm. That is the whole design philosophy."

The five experience principles

- **Invisible intelligence** — the system's intelligence is felt through better questions and clearer answers, never through exposed metadata.
- **Focused destinations** — each part of the product is a place you go to, which then fills the screen.
- **One question per screen** — every screen answers one question and offers one primary action.
- **Business language only** — in Human Mode, every word is a word the user's business uses.
- **Calm visual energy** — energy comes from clarity and rhythm, not from density or decoration.

2 Navigation architecture

FiltraQueri has six destinations and three navigation layers. The six destinations map to the user's own workflow, not to the engineering modules underneath. The three layers — destination, sub-view, detail — are the Epic-structured spine of the whole product.

Home — where do I start. Data — what do I have. Analyze — what do I want to know. Insights — what did I find. Analyst — inspect the machinery when needed. Settings — configure the product.

3 Home — the calm landing

Question it answers. “Where do I start?”

Epic pattern used. The quick-link tile model — a calm grid of clear, single-purpose doors.

Figure 3.1 — Home: a warm greeting, six quick-action tiles, recent work. No metadata, no competing entry points, one obvious door per task.

Key design decisions

- Six quick-action tiles, each a plain verb with a one-line description and a soft colour identity. The grid is the screen — not a panel buried in a dashboard.
- A warm, human greeting replaces any system-status header.
- Recent work appears as three simple cards with a colour spine showing its type (investigation, insight, data).
- Nothing technical. No readiness states, no runtime status, no metadata strip.

4 Data — what do I have

Question it answers. “What do I have?”

Epic pattern used. Structured sub-views — Overview, Columns, Worksheets; selecting one shows only that one.

Columns7

Text fields6

Date fields1

What FiltraQueri sees

This looks like a list of property managers. Each row is one manager; the columns describe their contact details and role.
Good for: comparing managers, grouping by role, contact summaries.

FiltraQueri checked your data

● All columns named

● No empty required fields

● 1 date field detected

● Ready to analyze

This dataset is ready

Figure 4.1 — Data: focused sub-views, a four-metric overview, plain-language understanding, and a contextual data-quality rail.

Key design decisions

- Three focused sub-views replace the old five-pill maze. Selecting one fully replaces the content — no stacking, no scrolling to find what changed.
- “What FiltraQuerì sees” states the dataset's meaning in plain business language — this is where the old Intelligence and Semantics tabs fold in, as understanding rather than as metadata.
- The right rail is contextual: on Data it shows data-quality checks and readiness, not a generic investigation dump.
- The dataset overview is four calm metric cells, not a wall of cards.

5 Analyze — what do I want to know

Question it answers. “What would you like to understand?”

Epic pattern used. Fresh-page composition — a deliberate, calm page sized to the task.

Figure 5.1 — Analyze: intent first. Suggested business questions, a plain-language plan preview, one primary action. The six-step query builder is gone.

Key design decisions

- The screen starts with intent — “what would you like to understand?” — not with query structure. The user picks a business question or types one.
- FiltraQuerí responds with a plain-language plan (“count properties for each manager, group by manager, sort from most to fewest”). No fields, no aggregations, no SQL.
- Nothing runs until the user chooses “Show me”. The approval gate is a calm, single action — never a wall of configuration.
- The right rail shows the question being shaped, as three simple steps.

6 Insights — what did I find

Question it answers. “What did I find?”

Epic pattern used. One focal point per screen — the answer leads, the table is the hero.

Insights > Manager workload

What did I find?

THE ANSWER

Two managers handle 60% of all properties. Workload is uneven.

Manager	Role	Properties	Share
A. Mensah	Senior	14	31%
K. Owusu	Senior	13	29%
J. Boateng	Regional	8	18%
P. Asante	Regional	6	13%
M. Darko	Associate	4	9%

Top contributor

A. Mensah - 14 properties

Most uneven role

Senior managers carry 60%

workload is uneven

WHAT TO LOOK AT NEXT

> Compare senior vs regional

> Rebalance the workload

> Save this insight

Figure 6.1 — Insights: the business takeaway leads in one sentence, the table is the hero surface, supporting findings sit below, the investigation thread is the single rail.

Key design decisions

- The business takeaway leads in one plain sentence — the answer the user came for, before any chart or table.
- The data table is the hero: large, clean, modern. It is never compressed by metadata above it.
- One right rail — the investigation thread — not the old dual sidebars. It shows where the user has been and offers the next steps.
- Supporting findings are two calm cards; engineering terminology is gone.

7 Analyst Mode — inspect the machinery

Audience. The analyst who wants to see the SQL, schema, and plan underneath.

Epic pattern used. Progressive disclosure — power is available, noise is not.

Figure 7.1 — Analyst Mode: the SQL editor is the hero surface; inspection (plan, schema, runtime context) sits behind progressive disclosure, collapsed by default.

Key design decisions

- The SQL editor is the visual centrepiece — given the most space, calm and professional.
- Inspection — execution plan, schema details, runtime context — is collapsed behind progressive disclosure. Available on demand, never displayed all at once.
- The schema rail is a clean field list, not an internal debug panel.
- Analyst Mode is the same shell and the same destinations as Human Mode — a rendering mode, not a separate application.

8 Settings — configure the product

Audience. Anyone configuring how FiltraQueri works for them.

Epic pattern used. Fresh-page composition — its own quiet layout, no borrowed chrome.

Figure 8.1 — Settings: real system settings in calm grouped rows. No dataset strip, no investigation rail, no analytical workspace chrome.

Key design decisions

- Settings has its own layout — it does not reuse the analytical workspace shell.
- Dataset metadata and the investigation rail are removed entirely; they do not belong here.
- Genuine settings are grouped into three calm sections — Experience, Data & trust, Account.
- Every option is plain language. “Confirm before deleting” is on by default.

9 How the system holds together

One shell, six destinations

Every screen is the same shell: a stable top bar, the six-item navigation, a focused centre, and — where the task warrants — a contextual right rail. Only the centre changes between destinations. The user learns the product once.

Consistency rules across all screens

- One page title per screen. One primary action per screen.
- The navigation replaces the screen; contexts never stack.
- The right rail adapts to the destination, or collapses when it has nothing useful to say.
- Human Mode shows business language only. Engineering vocabulary lives in Analyst Mode.
- Three type weights, one accent colour, three flat surface layers — the visual foundation is identical everywhere.

The colour identities

Each destination carries a light colour identity, used sparingly — Home blue, Data cyan, Analyze purple, Insights teal, Analyst slate, Settings grey. It is a quiet wayfinding cue, never decoration.

This guide and the specifications

This guide shows the designed experience. The binding rules behind it live in four canonical specifications: the Workspace Layout Specification (visual foundation, density, the shell), the Human Mode Interaction Specification (language, guided flows, mode behaviour), the Optimization Intelligence Architecture Specification (the optimization and forecasting surfaces inside Analyze), and the Consumer Architecture Governance Specification (detail pages, navigation, back behaviour). The UX Overhaul Master Plan sequences the build. This guide is the picture; those documents are the law.

The success test

"Could the user this product is for — someone overwhelmed by SQL and BI tools — look at any of these six screens and know what it is telling them and what to do next, without learning a single system concept?"

When every screen passes that test, FiltraQueri has become what it set out to be: not another BI tool, but the one that finally felt approachable.
